COLUMBIA UNIVERSITY
Statistical Inference and Modeling
Quiz 2

Prof. Marco Avella
TA: Ian Kinsella
October 1, 2019

Name:

UNI:

You have 20 minutes to answer the following questions. Good luck!

Question 1 (3 points)

Let $X_1, \ldots, X_n \overset{i.i.d.}{\sim} N(0, \sigma^2)$. Propose a sufficient statistics and show that it is minimal. Use it to find the minimum variance unbiased estimator of σ^2.

$$f(x_1, \ldots, x_n | \sigma^2) = \left(\frac{1}{\sqrt{2\pi}\,\sigma}\right)^n e^{-\frac{1}{2\sigma^2}\sum_{i=1}^n x_i^2} \Rightarrow T(\boldsymbol{x}) = \sum_{i=1}^n x_i^2 \text{ is sufficient}$$

$$\frac{f(x_1, \ldots, x_n | \sigma^2)}{f(y_1, \ldots, y_n | \sigma^2)} = e^{-\frac{1}{2\sigma^2}\left(\sum_i x_i^2 - \sum_i y_i^2\right)}$$ not a function of σ if and only if $T(\boldsymbol{x}) = T(\boldsymbol{y})$ 1.5 points

$\Rightarrow$ $\sum_i x_i^2$ is minimality sufficient and complete since we have a normal random sample

Hence $\hat{\sigma}^2 = \frac{1}{n}\sum_{i=1}^n x_i^2$ is the MVUE

1,5 points

since $\mathbb{E}[X_1^2] = \sigma^2$

Question 2 (3 points)

A dietetics student wants to look at the relationship between calcium intake and knowledge about calcium in sports science students. Further she wants to know if knowledge about calcium can be used to predict calcium intake (in mg/day) of the students. She collected data on 20 students and obtained the following table.

	Coefficients	Std. error	t-value
(intercept)	373.743	55.067	6.787
Knowledge score	13.897	1.748	7.951

1. Use a linear model to formulate a null hypothesis corresponding to the scientific question of interest. Suggest a null hypothesis leading to a one-sided test.
2. Compute an exact 95% confidence interval for slope parameter.
3. What is the average daily calcium intake of a student with no knowledge about calcium?

1) If one expects that knowledge of the benefits of calcium would induce students to increase their daily consumption one would state $H_0: \beta \geq 0$

2) $CI_{0,95}(\beta) = [\hat{\beta} \pm t_{18;\,0,975} \, \hat{\sigma}_{\hat{\beta}}] = [13,897 \pm 2,101 \cdot 1,748]$

3) $\hat{y} = \hat{\alpha} + \hat{\beta} \cdot 0 = 373,743$

Question 3 4 points

Figure 1: Kaplan-Meier estimates of survival function for advanced lung cancer patients

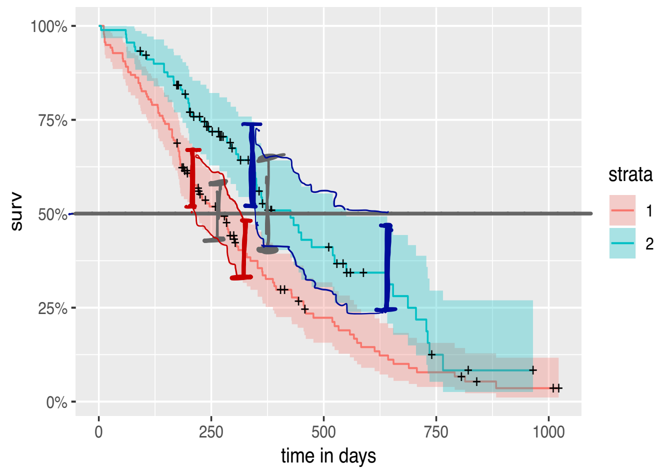

Figure 1 shows the estimated survival functions of patients with advanced lung cancer. Group 1 are male patients, group 2 are female patients. Comment what you observe. In particular, can we say that a group has a better median survival? does the data look exhibit any differences before and after the first year?

1 Female patients seems to have a better survival function than males throughout most of the time and the pointwise confidence intervals do not overlap too much

1 One cannot say that the estimated medians are statistically different from each other based on the pointwise confidence intervals.
1 However we can see that the sets of confidence intervals covering the median survival times in both groups are disjoint, suggesting they are indeed different.

1 There are more censored data in the first year. The variability of group 2 increases during the second year. Towards the end of the second year the CI of males is contained in the CI for females.

Table of the t Distribution

If X has a t distribution with m degrees of freedom, the table gives the value of x such that $\Pr(X \le x) = p$.

m	$p = .55$	.60	.65	.70	.75	.80	.85	.90	.95	.975	.99	.995
